

ISOFT · INTEGRATION SUITE

CS-Cart *Integration*

Keep the itec.co.ao storefront's stock and prices in step with ERPNext — automatically, safely, and from one screen. Including stock merged from other ERP sites.

Developed by **Abbass Chokor** · ERPNext v13 ↔ CS-Cart 4.16 · One-way · ERPNext → CS-Cart

[Going live](#) [Roadmap](#)

OVERVIEW

What this app allows you to do

The ISOFT CS-Cart Integration connects your ERPNext system to the CS-Cart online store. It reads what you have in stock — across your own warehouses and even other ERP instances — and keeps the website's quantities (and, optionally, prices) accurate, pushing only what actually changed.

Sync stock to the store

Push available quantity from your chosen warehouses to matching CS-Cart products. Only changed items are sent — one update each.

Merge stock from other ERPs

Pull item stock from other ERPNext sites (e.g. Unicom) over a secure token and fold it into the quantity the website shows.

See every difference

Browse the whole catalogue matched to ERP, with local, per-source and total quantity beside the site value — sortable, at a glance.

Find gaps

List ERP items that have stock but aren't on the website yet, so nothing sellable is missing from the store.

Run it safely

Dry-run previews, abort guards, a circuit breaker and an external-source failure policy — so a bad number never reaches the store.

One console

Everything lives on a single full-screen page. No ERPNext desk knowledge needed to operate it day to day.

THE CONSOLE • /CSCART

A single screen to run it all

Open **ISOFT Applications** → **CS-Cart** (or go to `/cscart`). The dashboard shows how many products are mapped, how many are matched to ERP items, how many are site-only, and when the last sync ran. The top bar carries the everyday actions: **Test** **Refresh Map** **Full Sync** **Sync Now**.

Getting started

1. Fill in **Connection** under Settings, then press **Test**.

2. Press **Refresh Map** to pull the CS-Cart catalogue.

3. Open **Preview** to review the match rate and planned changes.

4. Keep **Dry Run** on for a day, then enable Stock on a few SKUs first.

Dashboard. Health at a glance, plus the recent-runs feed. Status pills show whether it's enabled and in dry-run.

PRODUCTS & STOCK

Every product, matched and compared

The **Products** tab lists the store's catalogue matched to ERP by SKU (product code ↔ item code). Filter by **All** · **Matched** · **Unmatched** · **Stock Δ** · **Missing on Site**, search, and click any column header to sort. When external sources are on, quantity is broken out into its own columns — **Local ERP Qty**, one column per source, and **Total ERP Qty** — beside the **Site Qty** and the difference.

Stock source. Pick the warehouses to fetch from in a searchable, checkable table; group warehouses roll up their children.

EXTERNAL STOCK SOURCES

Stock from more than one ERP

Add other ERPNext instances as **External Stock Sources**. Each connects with a Frappe API token, matches by item code, and chooses how it combines with your local stock — **Add on top**, **Fill gaps**, or **Replace local**. Press **Test** to confirm it's pulling (e.g. Unicom returns 388 items). The merged number is what the store receives, and it appears in its own Products column.

The screenshot shows the 'Settings' page for 'CS-Cart' under the 'External Stock Sources' section. The interface includes a sidebar with 'Dashboard', 'Products' (3578), 'Settings', and 'Logs'. The main content area has a 'Settings' header with 'Connection, stock source and filters' and status toggles for 'DISABLED' and 'DRY RUN'. Below this are filters for 'Exclude', 'Brands', 'By Item Group', and 'Item Groups'. A 'Skip disabled items' toggle is also present. An 'ADVANCED (PRICE, CREATE & GUARDS)' section is collapsed. The 'EXTERNAL STOCK SOURCES' section is expanded, showing a list of sources. The 'Unicom' source is enabled and configured with the following details: Base URL (https://erp.unicom.co.ao), API Key (8d52e60356f28f8), API Secret (***** (set — blank keeps it)), Merge Mode (Add on top), and Remote Warehouses (blank = all warehouses on the remote). A 'Verify SSL' toggle is also shown. At the bottom, there are 'Revert' and 'Save Settings' buttons.

External sources. Per-source URL, token, merge mode and a Test button. Add as many as you need.

⚠ **If a source goes down:** the failure policy decides what happens — **Skip the run** (default, nothing is pushed until it's back), **Use last-known values**, or **Use local only**. You're emailed whenever a run fails or aborts.

UNDER THE HOOD

How the sync works

When enabled, the scheduler checks every few minutes and runs on your chosen frequency. Each run is a short, safe sequence:

1

Read local stock

Sum available quantity across your selected warehouses, on your chosen basis (actual, actual – reserved, or projected).

2

Pull & merge external sources

Fetch each enabled ERP source and combine per its merge mode into a single total per item.

3

Compare to the store

Check the total ERP quantity against the last-known site value; work out exactly what changed.

4

Push only the differences

Send one update per changed product to CS-Cart, with retry, backoff and a circuit breaker if the store starts failing.

5

Log & alert

Record the run with full counts; email you on any failed or aborted run.

Safety by default. Dry Run computes and logs without writing. Guardrails abort a run if too many items would zero out or too many changes are queued at once. And an unreachable external source pauses the run rather than pushing reduced stock.

GOING LIVE

Moving to production

The integration ships disabled and in dry-run. To take it live:

- ✓ Install the app on the production ERPNext and enter the real store & source credentials.
- ✓ Whitelist the production server's outbound IP in Cloudflare for `/api/*` on the store.
- ✓ Make sure the bench scheduler is running.
- ✓ Keep **Dry Run** on for a day and review **Products → Stock Δ**.
- ✓ Set the external-failure policy and an alert email, then turn Dry Run off and enable.

ROADMAP

Where it's headed next

Phase 1 is products and stock. The same connection opens the door to a full two-way link between ERPNext and the storefront — bringing orders, customer accounts and documents together.

Order sync, both ways

PLANNED

Sales order status

PLANNED

Orders placed on the storefront flow straight into ERPNext as sales orders, and their status flows back to the site — no re-keying.

Customers follow their order live — confirmed, paid, processing, shipped — pulled straight from ERPNext.

PLANNED

Balances & statements

Account customers check their outstanding balance and open an up-to-date account statement from their storefront login.

PLANNED

Print documents

Generate and print invoices, receipts and order documents directly, straight from ERPNext's records.

PLANNED

Customer sync

Keep customers and contacts aligned between ERPNext and CS-Cart, so accounts and pricing stay consistent.

PLANNED

Shipments & tracking

Push tracking numbers to the store as orders ship, so buyers always know where their delivery is.
